

PRESSURE REDUCING VALVE RP45 (Threaded)

DESCRIPTION

The ADCA RP45 series pressure reducing valves are single seated, bellows sealed controllers that operate without auxiliary energy. Designed for use with steam, compressed air, and other gases compatible with the construction.

They are particularly suitable for reducing steam pressure in all energy and process systems where pressures must be kept under control.

MAIN FEATURES

Specially designed high durability bellows, providing pressure balancing and frictionless plug stem.

Robust construction (fit-and-forget).

Suitable for use with high pressure turndowns.

Interchangeable actuators.

OPTIONS: Soft sealing version in PTFE/GR for use with steam.
Nitrile rubber soft sealing version for air and gas applications, where tight shut-off is required.
Low-noise flow divider.

USE: Steam, compressed air and other gases compatible with the construction. Limited use with liquids. Consult manufacturer before installing the valve with liquids.

AVAILABLE MODELS: RP45S and RP45ST or N – cast steel.
RP45i and RP45iT or N – stainless steel.
(All wetted parts free of ferrous metal or in stainless steel.)
Suffix T: soft sealed with PTFE/GR.
Suffix N: soft sealed with nitrile rubber.

SIZES: 1/2" to 1".

CONNECTIONS: Female threaded ISO 7 Rp or NPT.

AVAILABLE ACTUATORS: A1, A11, A12, A3, A4 – carbon steel.
A2, A21 – SG iron or carbon steel.
A1iS, A11i, A12i, A2i, A21i, A3i and A4i – stainless steel.

INSTALLATION: See IMI – Installation and maintenance instructions.

CORRECTION FACTORS

Pressure ratio:

The capacities given in the table above are applicable in scenarios where P2 < 0,7 P1.

In the remaining scenarios a correction factor must be applied:

PRESSURE RATIO * P2 / P1	CORRECTION FACTOR f
≥ 0,7	1,25
≥ 0,8	1,6
≥ 0,9	2,25

* Pressure ratio in bar abs (barg + 1)

Superheated steam:

When the medium is superheated steam, instead of saturated steam, a correction factor must also to be applied. The required mass flow must be multiplied by the following factor:

$$\frac{V_h}{V_s}, \text{ where } V_h = \text{specific volume of superheated steam, and } V_s = \text{specific volume of saturated steam.}$$

HOW TO SIZE (USING STEAM TABLE)

Example:

Required saturated steam capacity: 300 kg/h; Upstream pressure: 7 bar; Required downstream pressure: 5 bar.

Solution:

First determine correction factor for pressure ratio: $(5+1) / (7+1) = 0.75 \rightarrow f=1.25$,

Then multiply the given capacity: $300 \times 1,25 = 375 \text{ kg/h}$

Afterwards, refer to the cell with the number “7” in the column “INLET” of the saturated steam capacity table. In that line, the values for selection of the pressure reducing valve size can be found. In this particular scenario, a value equal to or higher than 375 kg/h is required and any of the values in the line is higher than that. Therefore, the closest value should be preferred, leading to a 1/2” valve selection.

On the actuator and spring selection table, for a downstream pressure of 5 bar, the recommended actuator is the A21, and the regulating spring is the N° 60.

Remarks: Never size the valve according to the pipe diameter in which it has to be fitted, but according to the actual flow required. Pipe sizing must also respect the maximum recommended flow velocities, according to the medium.

HOW TO SIZE (USING Kvs)

Please consult formulas on IS PV10.00 E or consult manufacturer.

HOW TO ORDER

RP45S 1/2” valve complete with spring N° 60, A21 actuator, condensate vessel and copper sensing pipe.

INSTALLATION

Horizontal installation with the actuator vertically, pointing downwards.

Installation with the actuator pointing upwards is possible only when the medium temperature is below 90 °C.

The sensing pipe, if not fitted on the valve body, must be installed downstream of the valve at a minimum of 1 meter away or 15 pipe diameters.

In steam applications, a “Y” strainer, humidity separator and steam trap should be installed upstream of the valve.
